STRATEGY OVERVIEW

The RCG Safe Haven strategy is engineered to preserve capital during periods of elevated volatility and market dislocation. The portfolio maintains low-to-inverse correlations with major equity indices by concentrating in high-quality, interest-bearing government and investment-grade instruments. Tactical duration management exploits dislocations along the U.S. Treasury yield curve. The strategy dynamically adjusts its maturity profile in response to shifts in the macro-rate environment, targeting asymmetric risk/reward across the curve, with selective metals and commodities exposure as a hedge against inflationary pressures.

RCG Safe Haven

Income & Yield Profile · As of August 31, 2026 · Inception: May 2022

INCOME & YIELD PROFILE

Safe Haven is an **income-and-carry strategy**: a laddered book of U.S. Treasuries held to harvest contractual coupon income. When rates rise, the bonds mark down on a price basis — but that markdown pulls back to par at maturity while coupon income keeps accruing, so mark-to-market monthly returns understate the strategy. The forward yield metrics below describe what the model portfolio is engineered to earn and apply to any account managed to the strategy.

AVG YIELD TO MATURITY	CURRENT YIELD · TREASURY	BLENDED CURRENT YIELD	AVERAGE COUPON
4.30%	3.98%	3.57%	3.91%

AVERAGE DURATION	AVERAGE MATURITY	CREDIT QUALITY	1-YR CARRY CUSHION
5.78 yr	6.76 yr	Aa1 / AA+	+74 bps

ILLUSTRATIVE INCOME — PER DOLLAR INVESTED

$3,570 per year, for every **$100,000** invested · ≈ $298 / month per $100k

Income scales linearly with account size — a **$250,000** account would generate roughly **$8,925/year** (≈ $744/month). Figures use the strategy's blended current yield (3.57%); the Treasury sleeve alone currently yields 3.98%. These are illustrative estimates, not guarantees — actual income varies with holdings, market prices, and the timing of contributions.

● INCOME ENGINE — CONTRACTUAL

3.57% blended yield

Coupon income accrues every month regardless of price marks. At a 3.98% current yield on the Treasury sleeve and a 4.30% yield-to-maturity, this cash flow is contractual and senior — backed 100% by U.S. Government credit (Aa1 / AA+).

● PRICE — MARK-TO-MARKET

Reverts to par

At 5.78-yr duration, a +100 bp rate move marks the book down ~5.8% on paper — but every dollar of that markdown accretes back as bonds pull to par. The carry cushion absorbs a +74 bp rate rise over the next year before a 1-year total return would turn negative.

Source: Interactive Brokers PortfolioAnalyst, Safe Haven model portfolio. Yield to maturity, current yield, duration, average maturity, and credit quality are characteristics of the model portfolio held across all accounts managed to the strategy; they are forward-looking estimates that change as holdings, prices, and rates move, and are not guarantees. Illustrative income = invested capital × blended current yield and scales linearly with account size; it does not reflect any specific client account. The 1-year carry cushion is an approximation (yield ÷ duration) and ignores convexity and reinvestment. Current yield = coupon income ÷ market value.
